### Abstract

The presentation provides a brief review of recent cross-cultural research on personality traits at both cultural and individual levels. It is argued that national mean scores of personality traits demonstrate a consistent pattern in their geographic distribution, a substantial level of agreement between self- and other-ratings, and a meaningful configuration of correlations with several relevant culture-level indicators but are unsystematically related to national character stereotypes. Warmth and wealth seem to be common determinants of national stereotypes; yet the origins of national character stereotypes probably differ from country to country. National character stereotypes about one's own nation are also formed in contrast to a dominant neighboring nation or to people's self-rated personality traits: the typical ingroup or outgroup member is portrayed in less socially desirable terms than people's ratings of their own personality
